

I've got the trunk spring remover for quite some time already and I finally got the time to install the heavy duty trunk spring that comes with the OEM trunk spoiler.

Here is what I did:

First remove the the clips that holds the **spare tire cover** and the **left trunk side trim panel**.

Here is the **trunk spring remover**

Use the trunk spring remover to take off the trunk spring. Its not that hard to remove the trunk spring with the right tool.

Putting the new spring back on is almost the exact opposite of what you did to remove them. I rest the trunklit on my back when removing and installing the spring.

Job done. Just make sure it works and looks the same as before you began to install the trunk spring 😊

This is one of the easier mod/upgrade to do. If you got the right tool, its almost a no brainer. 😊

In fact, I installed 1 heavy duty trunk spring and 1 regular trunk spring. I found that with both heavy duty trunk spring installed, the trunk pop up too strong when opening all the way. With this set up, I am with the amount of force it pop open the trunk and it's not too strong when opening it all the way.
