

Ok there are a lot of us that have this little problem. not such a big deal but its annoying as hell. so i decided to document it and show how easy it was to fix.

Tools -
philips screw driver

1ST
you take these little hanging clips off, by removing the cover you will see the screw under it

then just pry off the panel with your hand (comes out very easy)

2ND
there is a screw in the top corner of the second panel, remove this screw so you can pull the panel back.

LAST
just pull the panel back and slid your hand in the hole! you will be able to feel the metal cylinder thing that you screw to the back of
your 12v source.

Thats it your done. hope this helped u guys out
